

Back Fat By Carcass Weight

BackFat X Carcass Weight

The report "BackFat X Carcass Weight" allows producers to see where individual animals fall in relation to backfat and carcass weight specifications. Animals that have too much backfat with too heavy of a carcass and animals that have too little backfat with too light of a carcass typically miss the target specs due to management issues, either feeding too long or not long enough, respectively. Animals that do not meet the target because they are too heavy with not enough backfat or too light with too much backfat are often not genetically positioned to meet the set specifications. To see which animals correspond with which points on the chart, move the cursor over the point on the chart. It will show the visual i.d. of the animal in the table to which the point refers.
